

# The Anatomy of Medical Technology Innovation

## - a pilotstudy

- ▲ **Research question, purpose, goal and vision** – *The research question of this pilot project deals with the importance of market knowledge and financial structures and solutions during the early stages of innovative projects in medical technology development. The purpose of this project is to increase knowledge and to create the basis for designing a larger research project. The vision is to create an international research network on the subject theme, through which research based medical technology development projects could exploit the research network and its knowledge when aiming at commercialisation.*
- ▲ **Expected results and effects** – *The pilot project should result in the design of a larger research project, including the definition of a number of international partners and a plan for financing.*
- ▲ **Delivery** – *The project has a qualitative research approach. Case studies, literature studies and interviews are the basis of the analysis. Interviews, and in some cases also workshops, are carried out with researchers, entrepreneurs and industrialists working in the field of medical technology.*

- ▲ **Project Participants:**

Bertil Guve (KTH)
